

Name: Ravina yadav

Academic Year: 2021-22

Roll No: 32

Class- MSC CS Part I

Subject:

Design and implementation of Modern Compilers

INDEX

SR NO	TITLE
1	Write a program to construct NDFA
2	Write a program to convert the given Right linear Grammar to Left Linear Grammar.
3	Write a code to generate DAG for input arithmetic expression.
4	Write a code to for triples.
5	Write a code for postfix evaluation.
6	Write a code to generate 3 address code
7	Write a code to demonstrate loop jamming for the given code sequence containing loop.
8	Write a code to demonstrate loop unrolling for the given code sequence containing loop.

Practical NO 1

Aim : Write a program to construct NDFA

Install package automata-lib

By using the following command:

```
pip install automata-lib
```

```
D:\Python>
D:\Python>pip install automata-lib

PRACTICAL NO 2

Aim: Write a program to convert the given Right linear grammar to Left Linear Grammar form.

CODE:

```
def get_transitions(rules):  
    my_dict={}  
    ld=""  
    res=dict()  
    r=""  
    for i in rules:  
        my_dict[i[0]]=i[1][1],i[1][0]  
    for sub in my_dict:  
        if isinstance(my_dict[sub],list):  
            res[sub]=ld.join([str(ele) for ele in my_dict[sub]])  
        print("Left linear grammar is:")  
    for item in res:  
        r+=item+"-"+str(res[item])+"\n"  
    print(str(r))  
  
rule_count=int(input("Enter rule count>\t"))
```

```
rules=[]

for i in range(rule_count):

    rules.append(input("Enter right linear grammar"+">\t"))

rules=[i.split("->") for i in rules]

print(rules)

get_transitions(rules)
```

OUTPUT:

```

).py
Enter rule count>          2
Enter right linear grammar> S->uP
Enter right linear grammar> T->qW
[['S', 'uP'], ['T', 'qW']]
Left linear grammar is:
Left linear grammar is:
S-Pu
T-Wq
```

PRACTICAL NO 3

Aim: Write a code to generate DAG for input arithmetic expression.

CODE:

```
def funct1(x):  
    main=[]  
    for i in range(0,x):  
        y=input()  
        main.append(y)  
    print("Label Operator left Right")  
    for i in range(0,x):  
        q=main[i]  
        if q[0] not in res:  
            res.append(q[0])  
        if(len(q)>3):  
            print(" ",q[0]," ",q[3]," ",q[2]," ",q[4])  
        else:  
            print(" ",q[0]," ",q[1]," ",q[2]," ")  
    print(main)  
    print(res)
```

```
print("Enter number of 3 address code")
```

```
x=input()
```

```
x=int(x)
```

```
res=[]
```

```
funct1(x)
```

Output:

```
= RESTART: C:/Users/Admin/Desktop/Msc CS/
Enter number of 3 address code
4
t=a-b
r=a-c
o=t*r
q=o
Label Operator left Right
    t      -      a      b
    r      -      a      c
    o      *      t      r
    q      =      o

['t', 'r', 'o', 'q']
|
```

PRACTICAL NO 4

Aim: Write a code for triples.

Code:

```
def funct1(x):  
    main=[]  
    for i in range(0,x):  
        y=input()  
        main.append(y)  
    print("Address operator argument 1 argument2")  
    for i in range(0,x):  
        g=main[i]  
        if g[0] not in res:  
            res.append(g[0])  
        e=funct2(g[2])  
        if(len(g)>3):  
            r=funct2(g[4])  
            print("  (" ,i,")", "  ",g[3], "  ",e, "  ",r)  
        else:  
            print("  (" ,i,")", "  ",g[1], "  ",e, "  ")
```

```
    print(main)

    print(res)
def funct2(g):
    try:
        z=res.index(g)

        return(z)
    except:
        return(g)
print("Enter number of production")
x=input()
x=int(x)
res=[]
funct1(x)
```

Output:

```
y
Enter number of production
4
t=a-b
u=a-c
w=t*u
e=w
Address operator argument 1 argument2
( 0 )      -      a      b

( 3 )      =      2
['t=a-b', 'u=a-c', 'w=t*u', 'e=w']
['t', 'u', 'w', 'e']
|
```

PRACTICAL NO 5

Aim: Write the code for Postfix Evaluation

CODE:

```
def postfix_evaluation(s):  
    s=s.split()  
    n=len(s)  
    stack=[]  
    for i in range(n):  
        if s[i].isdigit():  
            stack.append(int(s[i]))  
        elif s[i]=="+":  
            a=stack.pop()  
            b=stack.pop()  
            stack.append(int(a)+int(b))  
        elif s[i]=="*":  
            a=stack.pop()  
            b=stack.pop()  
            stack.append(int(a)*int(b))  
        elif s[i]=="/":
```

```
        a=stack.pop()
        b=stack.pop()
        stack.append(int(a)/int(b))
    elif s[i]=="-":
        a=stack.pop()
        b=stack.pop()
        stack.append(int(a)-int(b))
    return stack.pop()
```

```
s="8 7 8 * + 4 -"
```

```
val=postfix_evaluation(s)
```

```
print(val)
```

OUTPUT:

-60
|
```

PRACTICAL NO 6

Aim: Write a code to generate 3 address code

Code:

```
postfix=input("Enter postfix expression").split()
```

```
operators=['+', '-', '/', '*', '^']
```

```
stack=[]
```

```
result=""
```

```
str1=""
```

```
count=0
```

```
print("3 address code")
```

```
for i in postfix:
```

```
    if i not in operators:
```

```
        stack.append(i)
```

```
        print("Stack-",stack)
```

```
    else:
```

```
        op1=stack.pop()
```

```
        op2=stack.pop()
```

```
        result=op2+i+op1
```

```
        str1='T'+str(count)
```

```
stack.append(str1)

print("T",count,"=",result)

count+=1
```

Output:

```
- RESTART. C:\Users\Admin\Desktop\MSC CS\SEM 2\Compiler
